THE POWER OF A SMALL WORLD

Laserloddemaskin,  
revitalisert teknologi for  
kompliserte  
sammenstillinger

A photograph of a pilot in the cockpit of an aircraft. The pilot is seen from the side, looking out through the window. The cockpit is filled with various control panels, switches, and displays. The lighting is dim, creating a focused atmosphere.

## Sammendrag

---

Del 2 **Laserloddeteknologi**

---

Del 3 **Løsning**

---

Del 4 **Erfaringer**

A photograph of a pilot in the cockpit of an aircraft. The pilot is wearing a white shirt and sunglasses, looking out through the front window. The cockpit is filled with various control panels, screens, and instruments. The background shows a blurred view of the sky and clouds.

# Why Laser?

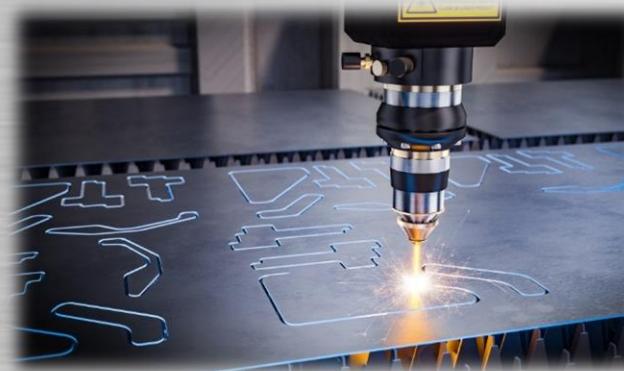

## Common Laser applications

Laser annealing

The laser turn the metal surface color. On titanium it's also possible obtain different colors.  
Used on industrial application for marking & traceability

Laser cutting

An high energy laser knife (up to 1KW) is able to easily cut metal sheet with 10mm thickness or even more

Laser spot welding

The laser weld the metal by a single high power spot.  
Used in jewelry manufacturing to weld gold, platinum and silver

Laser plastic printing

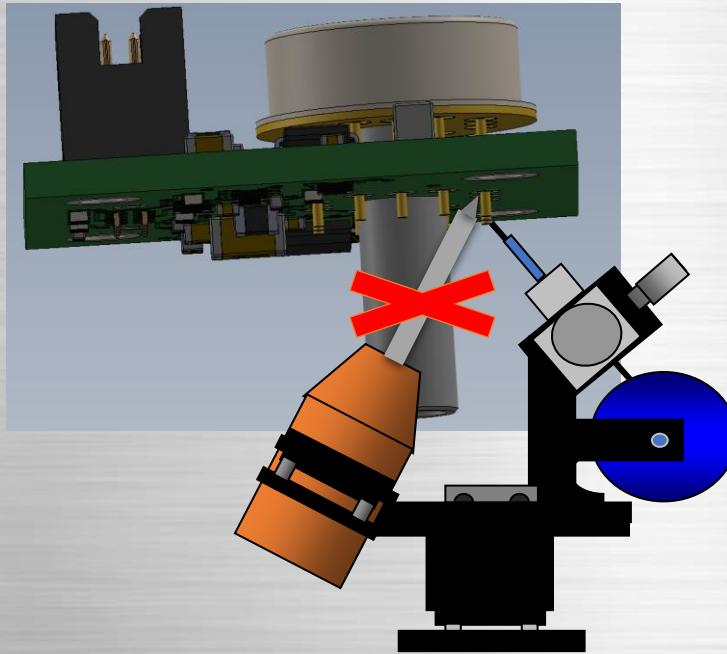

A low power laser is able to print polycarbonate document to produce text and images with high resolution.  
Used in ID and passport printing

# How Laser Works

# How Firefly Laser Works

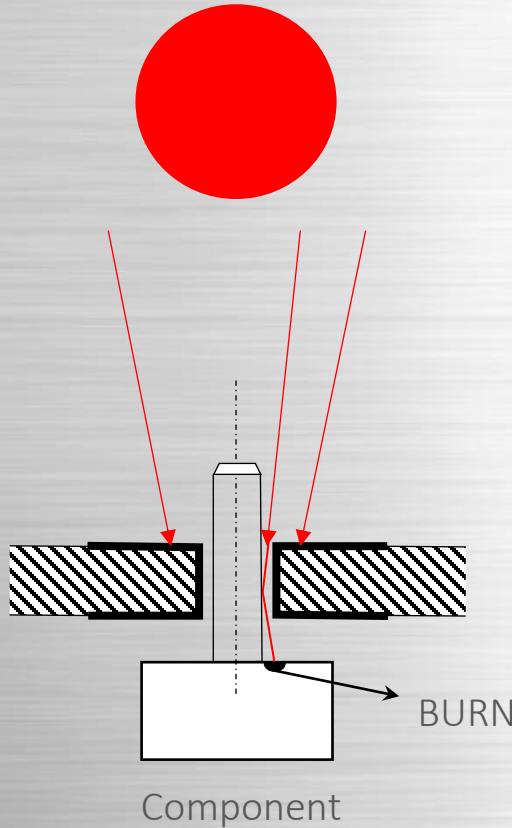

**FIREFLY**  
LASER SOLDERING  
**NEXT > SERIES**

# Full laser beam vs ring shaped laser beam

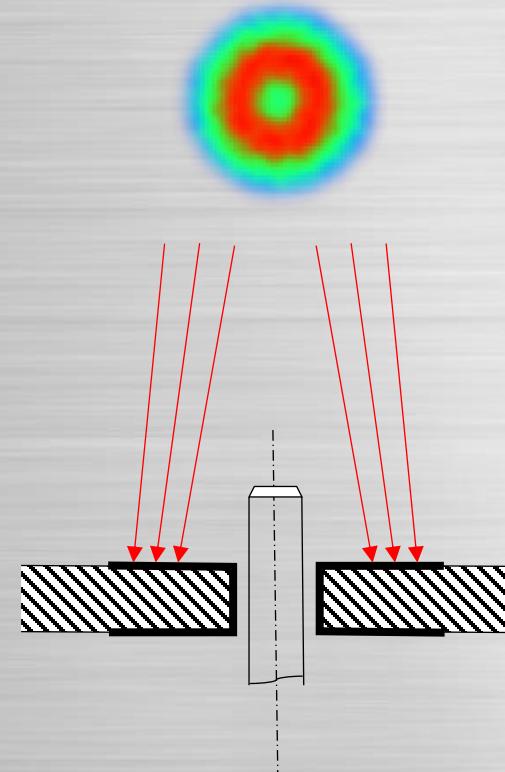

**FIREFLY**  
LASER SOLDERING  
**NEXT > SERIES**

## Full laser beam

Full laser beam has 2 main issues. The higher spot energy is close to the center. This kind of laser overheats the pin causing an immediate pin oxidation that avoid the intermetallic connection. Cold solder. Part of the energy pass through the pin hole and burn the component body on the other pcb side

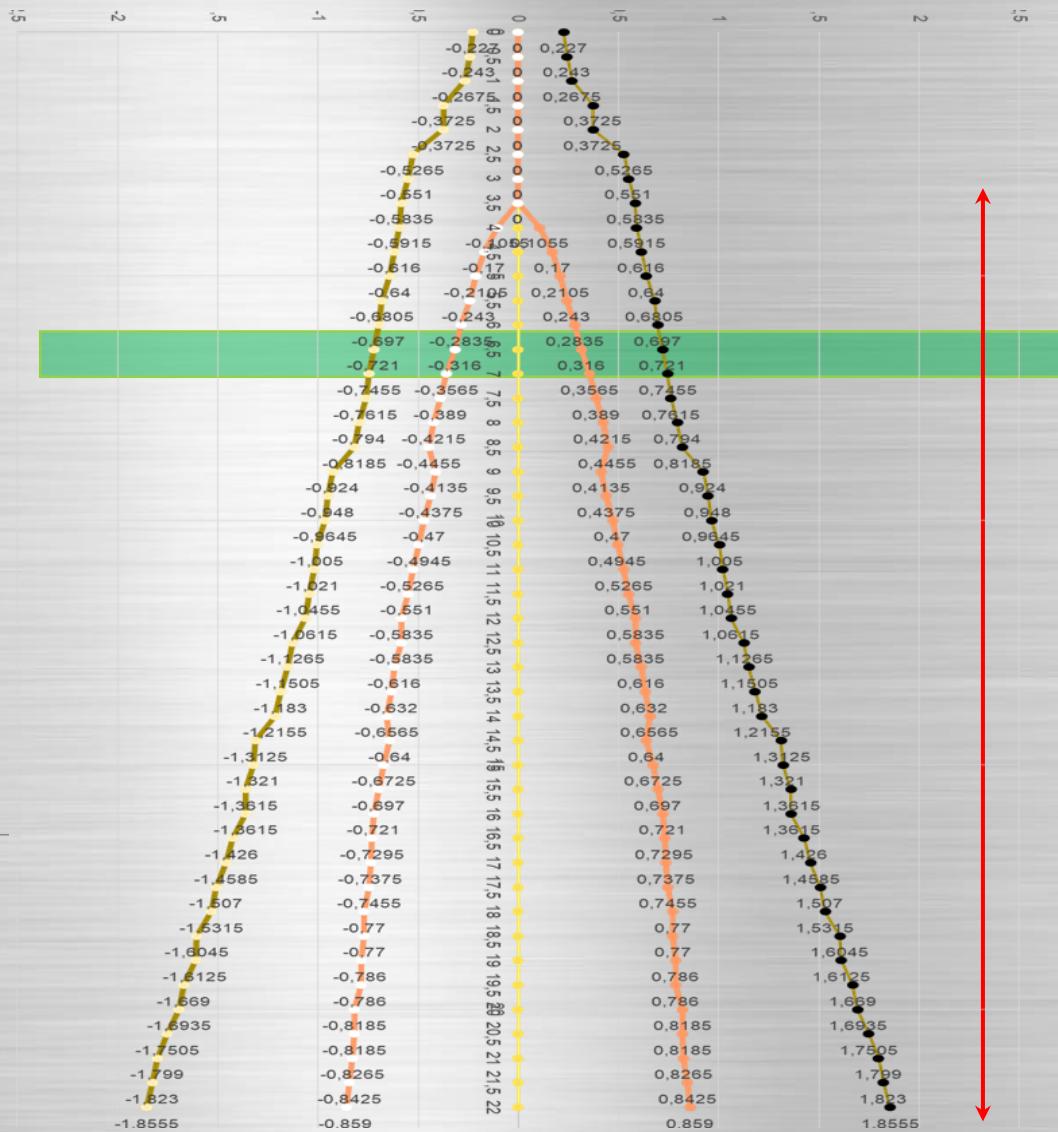

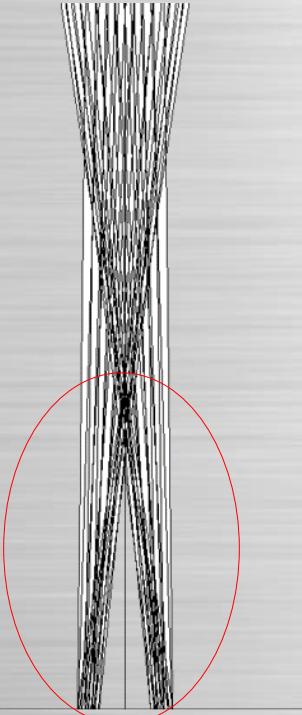

## Firefly laser beam

The Firefly laser beam drive the energy on the PCB metal ring without overheat the pin. This ring shaped spot give us the possibility to use less power compared to a full spot laser beam and doesn't burn the component on the other pcb side.

## Relationships:

- ✓ Pad diameter
- ✓ Hole diameter
- ✓ Pin Height

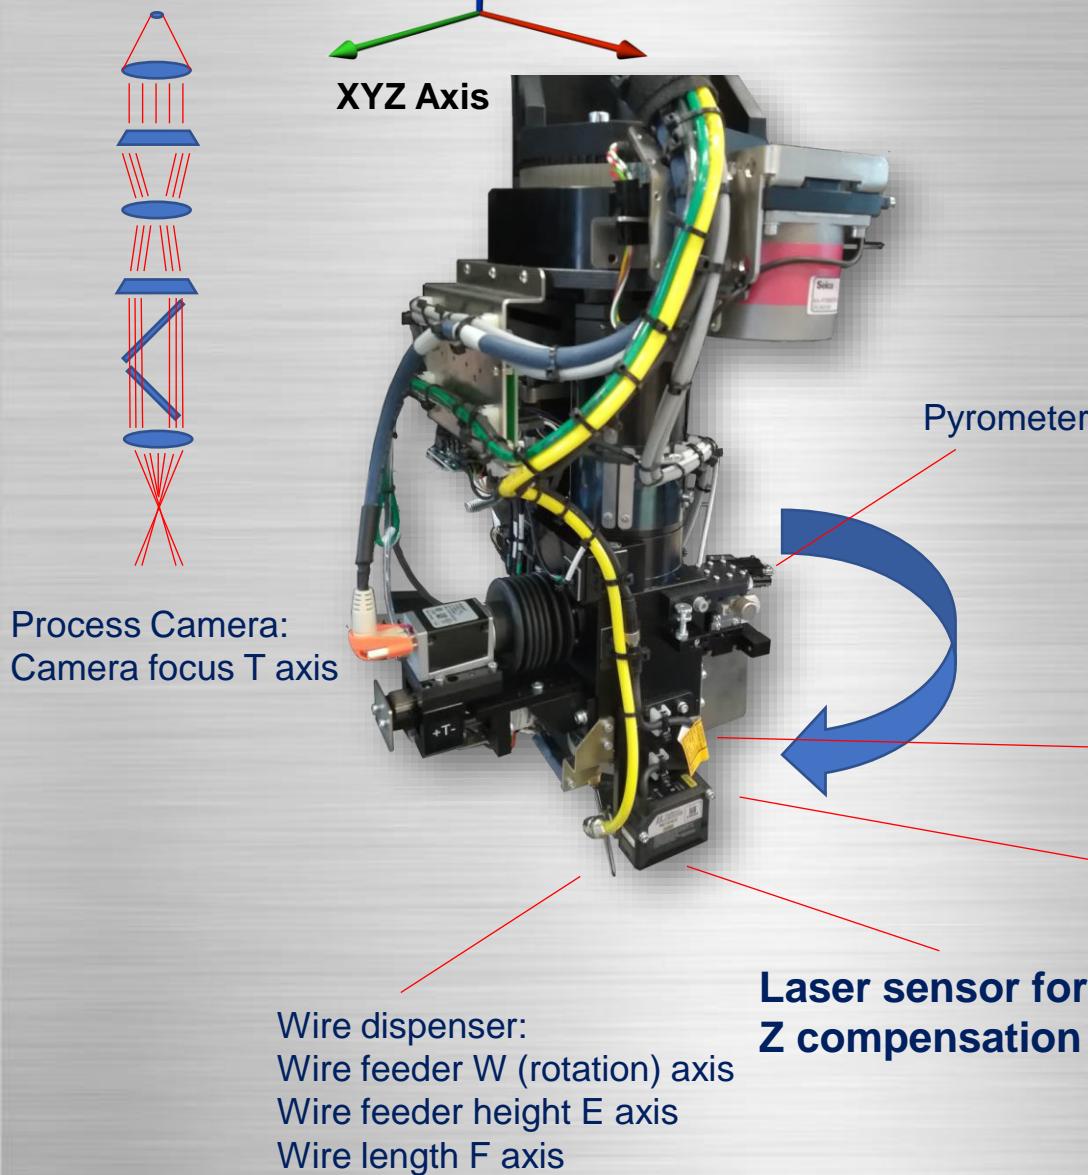

Pin height 0 – 2.2mm  
Internal/external diameter ratio adapted to  
common values used on pcb

# Firefly Structure

# Firefly Soldering Head Assembly

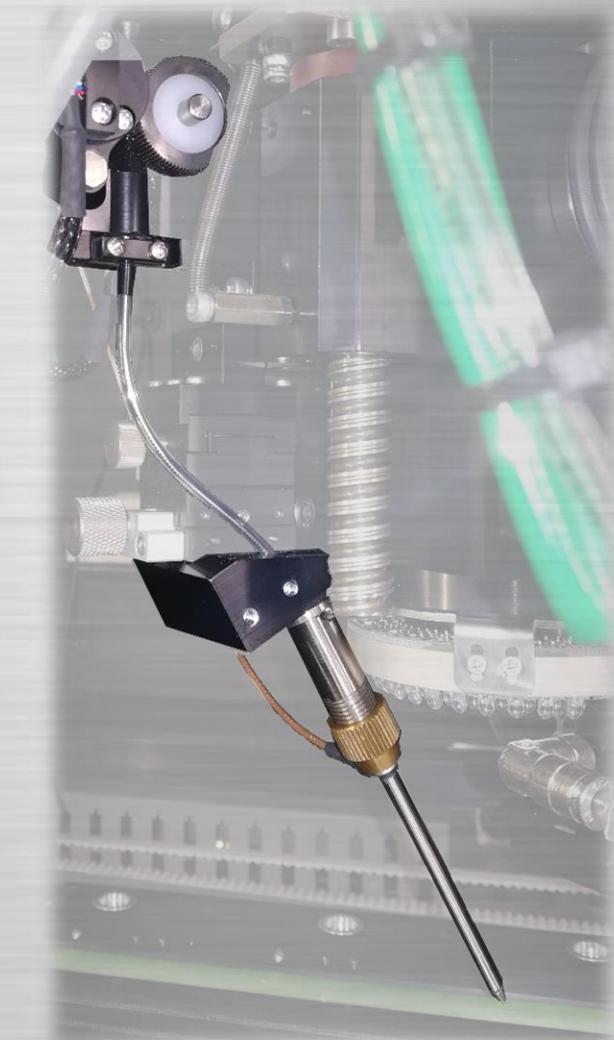

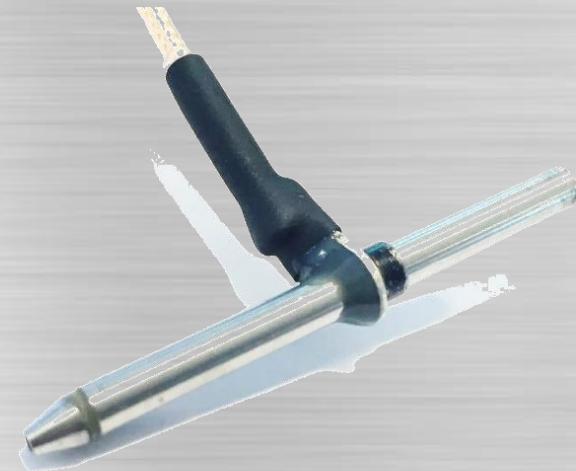

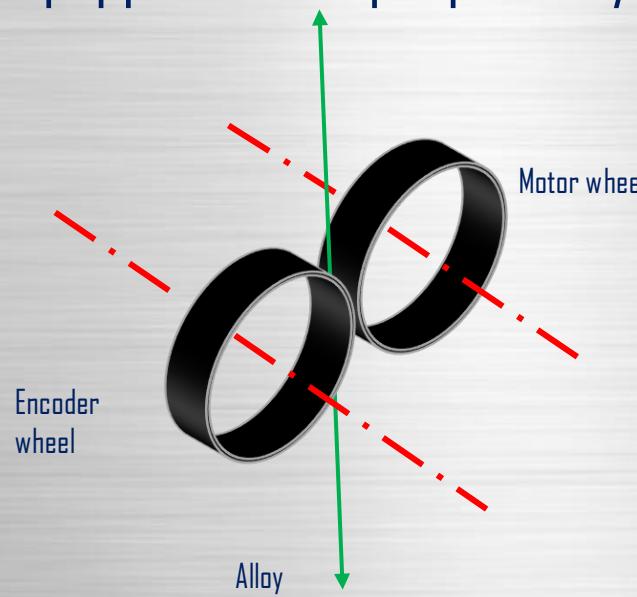

Local Fume Extractor

# Wire Feeding system

## The Dispenser of the wire:

- ✓ Can rotate independently
- ✓ Can rotate during soldering
- ✓ It's mounted on a Z independent axis
- ✓ It's encoder controlled for wire dispensing
- ✓ It's equipped with a proprietary wire capacitive sensor

# VIVA Next> software

- ✓ VIVA is the software managing the complete machine
- ✓ The Soldering Program is a sequence of **Solder Joint MACROs**
- ✓ Each solder joint can be managed with dedicated parameters and settings

Viva Application  
Add PCB data

Generate Solder Macros

<u>Step Name:</u> ...					
SolderJoint	4	J24-13	AngleStart	48	[ Dg ]
TempGradient	50	[ DgC/s ]	AngleRotation	0	[ Dg ]
SolderTemp	250	[ DgC ]	EndSolderTemp	-1	[ DgC ]
WireLength	6	[ mm ]	WireSpeed	10	[ mm/s ]
Post Temp	280	[ DgC ]	LaserID	1.3	[ mm ]
Post Time	0.5	[ s ]			
PreHeatTemp	180	[ DgC ]			
WaitPreHeat	1	[ s ]			

Negative Value of the LaserID will create a Solid Laser Spot

# How to Solder

## Laser Power/Time/Wire Profile

Soldering cycle is splitted in three sections:

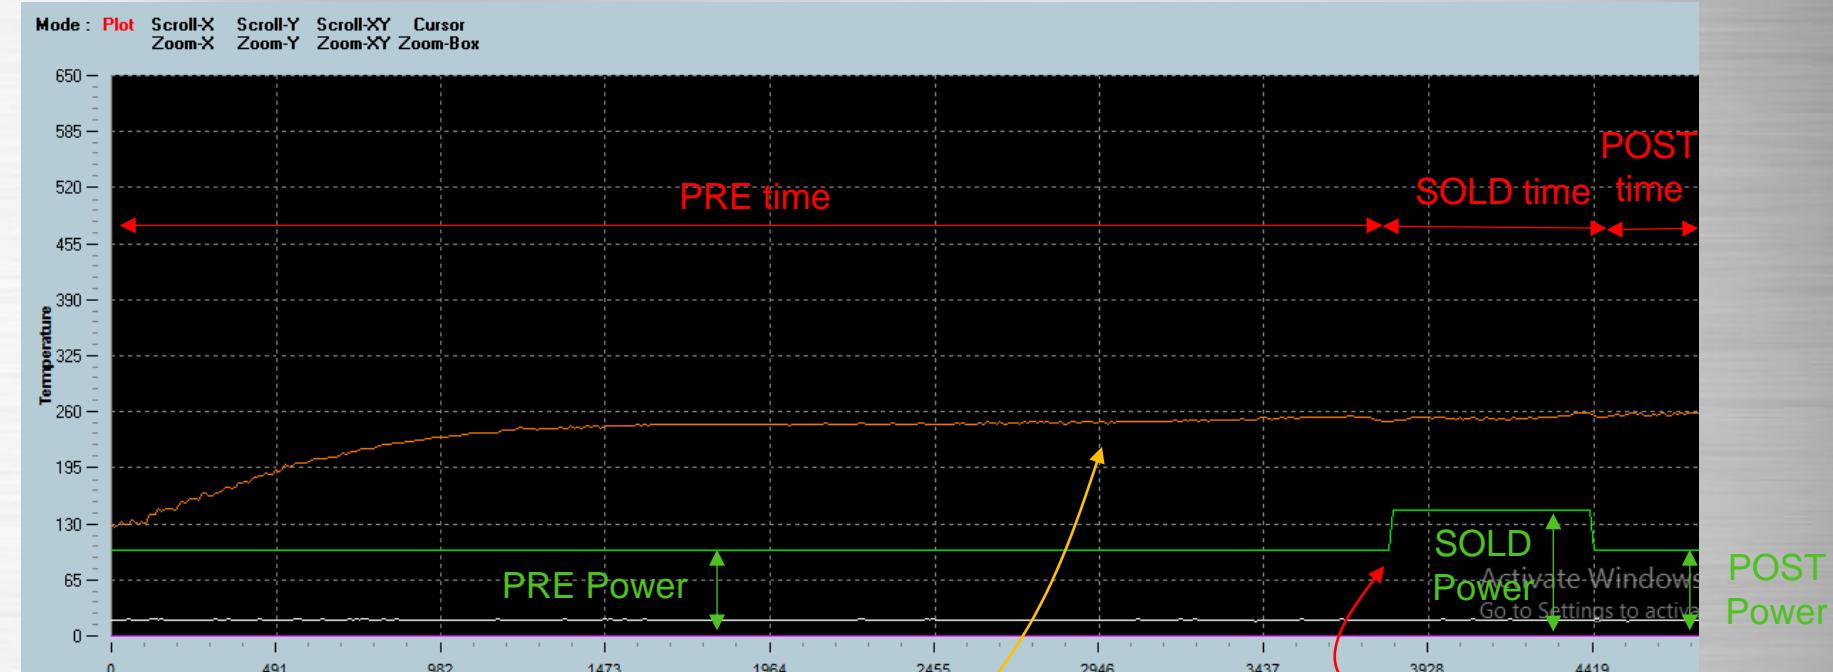

- PRE (preheat)
- SOLD (soak)
- POST (liquid)

For each section, the recipe can be customized in term of:

- ✓ Laser Power [W]
- ✓ Duration time [Sec]

Two other parameters:

- ✓ amount of wire [mm]
- ✓ wire dispensing time [Sec]

Pyrometer gives to the operator the right feedback to setup the best soldering profile

Wire dispensing will begin at the end of the PRE time

# Fordeler med Firefly Laser loddning

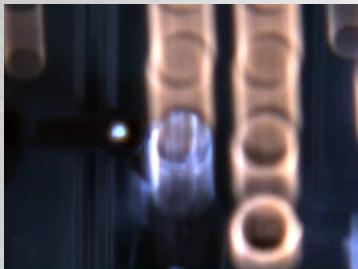

- ✓ Lavt strømforbruk. Laseren er bare aktivert under selve loddningen
- ✓ Ingen behov for oppvarmingstid etter oppstart
- ✓ Ingen forvarming nødvendig
- ✓ Reduserer termisk stress på kretskort
- ✓ Ingen høytemperaturinnretninger inne i systemet
- ✓ Minimalt behov for loddemateriale
- ✓ Behøver ikke ekstern fluss
- ✓ Enkel håndtering av kretskort
- ✓ Lavt vedlikeholdsbehov og enkel vedlikehold

Controlled process mean:

- ✓ Short soldering time
- ✓ No thermal stress
- ✓ No Cracks in inner layers
- ✓ Full hole filling

A photograph showing two pilots in the cockpit of an aircraft. The pilot on the left is wearing sunglasses and looking forward. The pilot on the right is seen from the side, looking towards the controls. The cockpit is filled with various control panels, screens, and instruments.
